APRIL 15, 2016

Data Highlights from the 2015 Hawai'i Youth Tobacco Survey

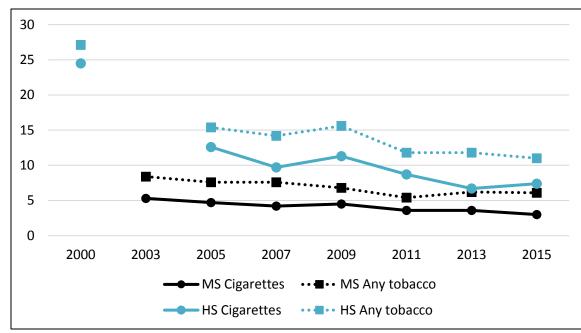

Tobacco Prevention & Control Program Chronic Disease Management & Control Branch Tobacco Settlement Project Hawai'i State Department of Health

2015 HYTS compiled by Lance Ching, PhD, MPH; Julia Chosy, PhD; Katherine Benson, BSc, MBA; Ranjani Starr, MPH 2003, 2005, 2011, & 2013 HYTS compiled by Tonya Lowery St. John, PhD, MPH 2007 & 2009 HYTS compiled by Ann Pobutsky, PhD 2000 HYTS compiled by Lila Johnson, MPH

Overview

The Hawaii Youth Tobacco Survey (HYTS) is a module of the Hawaii School Health Survey administered to public school students in grades 6-12 throughout Hawaii in odd-numbered years. This report presents a summary of the results from 2015. More detailed data tables for the state, including prevalence by sex, grade and race/ethnicity, 95% confidence intervals, and population estimates can be found at the Hawaii Health Data Warehouse (www.hhdw.org).

The overall impact of tobacco on the lives of Hawaii's youth has declined from 2000 to 2015. Fewer teens have experimented with using traditional forms of tobacco and fewer teens are current cigarette smokers. Tobacco use, especially cigarette use, has declined dramatically as has exposure to secondhand smoke. However, new tobacco products are a concern. Experimentation with electronic smoking devices increased dramatically from 2011 to 2015.

Prevalence

Figure 1: Current Tobacco Use (in the past 30 days) by School Type, HYTS 2000-2015. Note: 2000 MS and 2003 HS data are not reportable due to insufficient participation.

Significant progress has been made in reducing tobacco prevalence among Hawaii youth over the past decade.

▼ Lifetime cigarette use (ever smoked even one or two puffs) decreased by over 34% in middle school students (MS) from 21.2% in 2003 to 13.8% in 2015, and by over half in high school students (HS) from 63.3% in 2000 to 28.3% in 2015 (Tables 2 and 3).

✓ Current smoking (in the past 30 days) among HS students decreased by over 69% from 24.5% in 2000 to 7.4% in 2015 (Figure 1). Frequent smoking (on 20 or more of the past 30 days) was reduced over 80% from 10.3% in 2000 to 2.0% in 2015. Among MS students, current smoking declined from 5.3% in 2003 to 3.0% in 2015, and only 0.3% of MS students reported frequent smoking in 2015.

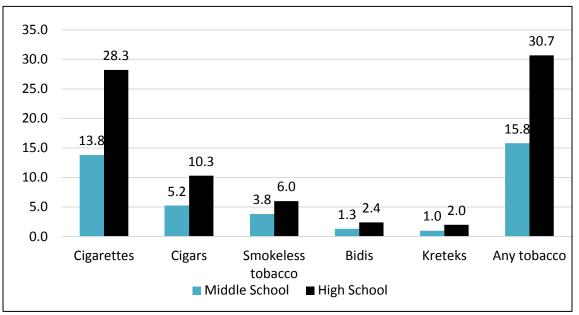

Figure 2: Ever Used Tobacco Products (lifetime use), HYTS 2015.

▼ Tobacco use is not limited to cigarettes alone (Figure 2). In 2015, 5.2% of MS students and 10.3% of HS students ever tried cigars and 3.8% of MS students and 6.0% of HS students ever tried smokeless tobacco. One-sixth of all MS students and one-third of all HS students have ever tried cigarettes, cigars, smokeless tobacco, bidis hand-rolled cigarettes from India), or Kreteks (clove cigarettes).

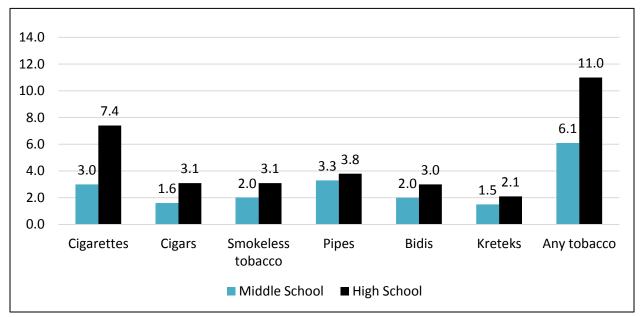

Figure 3: Currently Use Tobacco Products (in the past 30 days), HYTS 2015.

▼ Moreover, 6.1% of MS students and 11.0% of HS students report using cigarettes, cigars, smokeless tobacco, pipes, Bidis, or Kreteks in the past 30 days (Figure 3).

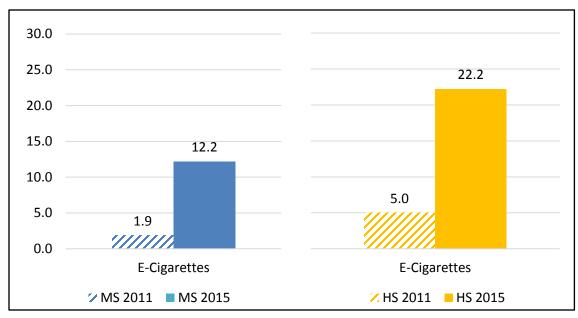

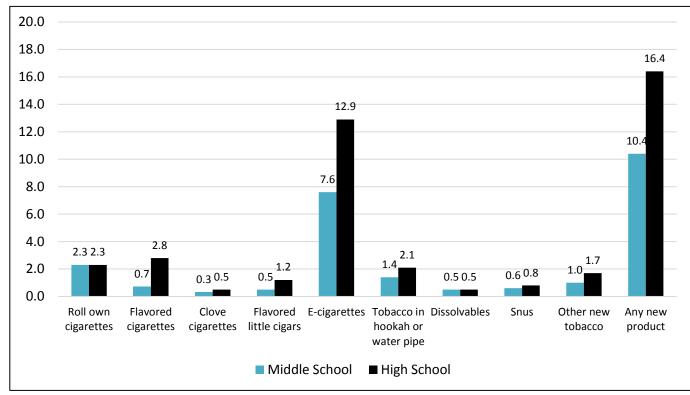

Figure 4: Ever Used NEW Tobacco Products - E-cigarettes (lifetime use), HYTS 2011 and 2015

- ▼ Due to the introduction of many new tobacco products, the HYTS introduced questions about lifetime and current use of *new* tobacco products.
- ▼ Lifetime use of new, non-traditional forms of tobacco has increased, with electronic smoking devices or E-cigarettes being most prevalent (Figure 4). Lifetime E-cigarette use increased six-fold among MS students from 1.9% in 2011 to 12.2% in 2015, and more than quadrupled among HS students during the same time period from 5.0% to 22.2%. In 2015, Hawaii youth were about equally likely to have tried new tobacco products as traditional tobacco products.

During the past 30 days, 10.4% of middle school students and 16.4% of high school students report using at least one new tobacco product in the past 30 days, with Ecigarettes being used most often (7.6% MS, 12.9% HS), followed by roll your own cigarettes (2.3% MS, 2.3% HS) and tobacco in a hookah or water pipe (1.4% MS, 2.1% HS) (Figure 5). Additionally, 2.8% of HS students used flavored cigarettes in the past 30 days.

Figure 5: Currently Use NEW Tobacco Products (in the past 30 days), HYTS 2015.

Access

Few smokers under the age of 18 years are able to purchase cigarettes at stores.

- ▼ Only 12.9% of MS and 17.4% of HS current smokers under 18 years of age bought their own cigarettes at a store in the past 30 days. However, 22.8% of MS students got cigarettes by borrowing or bumming them from friends, while 30.2% of underage HS smokers gave their friends money to buy cigarettes for them.
- ▼ Sales from unregulated venues remain a concern as 27.0% of MS and 28.6% of HS current smokers report buying cigarettes somewhere other than a gas station, convenience store, grocery store, drug store, vending machine, through the mail or the Internet in the past month.
- ▼ Only 22.4% of MS and 30.4% of HS current smokers under the age of 18 who tried to purchase cigarettes were refused sale because of their age in the past month.
- ▼ Additionally, 78.8% of MS and 86.7% of HS tobacco users under the age of 18 feel it would be easy to get tobacco products if they wanted them.

Schools & Communities

Students are learning about tobacco in school but there is room for improvement. The percent of students who have participated in the community event to discourage tobacco use has declined.

- ▼ Three in five MS students compared to approximately two in five HS students report being taught about why they should not use tobacco products in at least one class during this school year (60.8% MS, 42.3% HS); rates in 2015 represented a decline in tobacco education at school compared to 2013, when 73.0% of MS students and 46.3% of HS students had reported being taught about not using tobacco products.
- ▼ Only 10.3% of MS students and 10.4% of HS students participated in a community event to discourage tobacco use in the past year, down from 14.7% among MS students and 12.5% among HS in 2013.

Cessation

Most students who do smoke now have tried to quit in the past year, but many have been unable to stay off cigarettes for over 30 days. Very few students who use tobacco have participated in cessation programs in the past 12 months.

- ∇ 70.7% of MS and 68.4% of HS current smokers have tried to quit in the past year.
- ▼ 33.5% of MS and 38.7% of HS smokers were unable to abstain from cigarettes for one month during their last attempt.
- **V** Only 7.5% of MS and 4.1% of HS tobacco users attended a school program to help them quit in the past 12 months.
- V Less than 23% of current MS smokers and less than 25% of current HS smokers plan to stop smoking in the next 6 months.

Perceptions, Beliefs & Social Influences

Most students believe that tobacco products are dangerous and that they are being targeted by tobacco companies; nevertheless, there are more never smoking students susceptible to starting smoking than in any time since 2005.

- ▼ Nine out of ten students agree that all tobacco products are dangerous (90.5% MS, 89.2% HS), and about three out of five believe that tobacco companies try to get young people to smoke (59.5% MS, 61.9% HS).
- ▼ Still, 23.5% of MS students and 29.2% of HS students think that smokers have more friends, and 9.7% of MS and 10.8% of HS students think smoking makes young people look cool or fit in.
- ▼ 13.8% of MS students and 24.9% of HS students report that one or more of their four best friends smoke cigarettes.
- ▼ 25.3% of MS students and 38.9% of HS students report that one or more of their four best friends smoke e-cigarettes.
- ▼ The proportion of never smokers who are susceptible to starting smoking has increased to 14.3% among MS and 13.8% among HS never smokers (up from 11.8% MS and 8.6% HS in 2011).

Adult Counsel on Smoking

Less than half of all students report that their parents have talked to them in the past 12 months about not using tobacco, and few students report having their smoking status assessed by a healthcare provider or being advised not to smoke.

- ▼ The proportion of students who recall their parents or guardians talking to them in the past 12 months about not using cigarettes, chewing tobacco, snuff, dip, cigars or e-cigarettes is 42.8% among MS and 35.1% among HS students.
- ▼ Among MS and HS students who visited a doctor, dentist, nurse or other health professional in the past twelve months, only 25.3% of MS and 37.3% of HS students reported being asked if they used tobacco of any kind.
- ▼ Also, among students visiting a doctor, nurse, or other health professional in the past 12 months, only 32.0% of MS and 34.4% HS students were advised by a health professional to not use tobacco of any kind.

Media

Students are seeing and hearing fewer messages about the dangers of cigarettes on the TV, Internet and radio, but they are also seeing fewer people smoking on TV and in movies. However, new data shows that a significant proportion report receiving ads and coupons directly from tobacco companies.

▼ In 2015, 62.3% of MS and 61.8% of HS and students saw or heard at least one anti-tobacco ad in the past month and the proportion who report daily exposure has decreased by about half from 38.4% in 2003 to 21.6% in 2015 among MS students and from 40.7% in 2000 to 18.5% in 2015 among HS students.

- ▼ 61.9% of MS and 66.5% of HS students report that they often see actors smoking on TV or in the movies, down from 76.9% in MS and 87.1% in HS in 2005.
- ▼ 9.7% of MS and 8.1% of HS students received ads directly from a tobacco company in the past 30 days through the mail, e-mail, the Internet, Facebook, Myspace or a text message. Furthermore, 4.2% of MS and 4.6% of HS students received coupons from a tobacco company via one of these mechanisms in the past 30 days.

Second hand smoke (SHS)

Almost all students think that second hand smoke (SHS) is harmful to them. Exposure to SHS (in the past 7 days) has continued to decrease and more students report smoking is not allowed in their homes or cars.

- **V** Over 92% of MS and HS think that SHS is harmful to them.
- ▼ Only 20.4% of MS and 22.9% of HS students reported being exposed to SHS *at home* in the past 7 days.
- ▼ Only 16.1% of MS and 18.3% of HS students reported being exposed to SHS *in a car* in the past 7 days.
- ▼ From 2007 to 2015, the proportion of students who reported smoking was never allowed *in their home* increased from 76.4% to 81.5% among MS students and from 77.3% to 78.3% among HS students.

Conclusion

Tobacco use is still the leading preventable cause of death in the United States, and Hawaii has made great progress in reducing the toll of tobacco among youth. Nevertheless, there are still areas of concern. Although use of traditional tobacco products (cigarettes, cigars, smokeless tobacco and pipes) has decreased, experimentation with and current use of new tobacco products including E-cigarettes, tobacco in water pipes or hookah, and roll-your-own cigarettes are increasing and need to be monitored. Awareness of anti-tobacco campaigns has decreased and about one in ten students report receiving advertising directly from tobacco companies.

Background and Methods

The Youth Tobacco Survey (YTS) was designed by the Centers for Disease Control and Prevention (CDC) in collaboration with participating states. YTS surveys are conducted at the national, state, and city level. Additionally, many countries participate in the global YTS allowing for comparison across all participating areas.

The 2015 Hawaii YTS (HYTS) data used in this report were collected using a self-administered survey format and employed a two-stage cluster design to produce a representative sample of students in middle school (grades 6-8) and high school (grades 9-12). The first-stage sampling frame consisted of all public schools containing any grades 6-8 and grades 9-12. Schools with 6th grade as the terminal grade (elementary schools) were not included in the sample. Schools were selected with probability proportional to school enrollment size: 26 schools were selected for each sampling frame. The second sampling stage consisted of systematic equal probability sampling (with a random start) of classes from each school that participated in the survey. All students in the selected classes were eligible to participate in the survey. Passive parental consent was required for each student participating in the survey.

The overall survey response rates were calculated by multiplying the school response rate by the student response rate. In the middle school sampling frame, 26 of the 26 schools participated (100.00% of schools) and 2,244 of 2,590 eligible students participated (86.64% of students), yielding a survey response rate of 86.64% (100.00% x 86.64%). In the high school sampling frame, 24 of the 26 sampled schools participated (92.31% of schools) and 1,911 of 2,289 eligible students participated (83.49% of students), yielding a survey response rate of 77.06% (92.31% x 83.49%).

A weight has been associated with each questionnaire to reflect the likelihood of sampling each student and to reduce bias by compensating for differing patterns of non-response and to reflect the population of Hawaii children in public schools. Additional details on the methods can be found at <u>www.cdc.gov/mmwr</u>. Table 1 provides detailed demographic information on the 2015 HYTS respondents.

This overview provides summary results from the middle school and high school surveys for 2015 and compares them with the results from the 2000, 2003, 2005, 2007, 2009 2011, and 2013 HYTS. Table 2 provides prevalence of selected indicators among middle school students and Table 3 provides the prevalence among high school students. Middle school data for 2000 and high school data for 2003 are not reportable due to inadequate response rates on those years. More complete data tables with results by year and gender, grade and Hawaii-specific race-ethnicity can be found on-line at the Hawaii Health Data Warehouse http://www.hhdw.org/cms/index.php?page=yts-reports.
